

1. How would you link to the named fragment #jobs on the page employ.html from the home page of the site?

- a. `<a href="employ.html#jobs">Jobs</a>`
- b. `<a name="employ.html#jobs">Jobs</a>`
- c. `<a link="employ.html#jobs">Jobs</a>`
- d. `<a href="#jobs">Jobs</a>`

2. Which pseudo-element can be used to generate content that precedes an element?

- a. `:after`
- b. `:before`
- c. `:content`
- d. `:first-line`

3. Which of the following is a mobile web design best practice?

- a. Configure a multiple-column page layout.
- b. Avoid using lists to organize information.
- c. Configure a single-column page layout.
- d. Embed text in images wherever possible.

4. Find the Error. The page below is intended for the navigation area to display on the right side of the browser window. What needs to be changed to make this happen?

Change float: left; to float: right;

```
nav { float: right;  
width: 120px; }
```

Trillium Media Design

Our professional staff takes pride in its working relationship with our clients by offering personalized services that listen to their needs, develop their target areas, and incorporate these items into a website that works.

5. Web research As you read about mobile web design best practices in this chapter, you may have noticed some overlap with techniques that provide for accessibility, such as alternate text and use of headings. Explore the Web Content Accessibility and Mobile Web document at <http://www.w3.org/WAI/mobile>. Explore related links that interest you. Write a one-page, double-spaced summary that describes areas of overlap and how web developers can support both accessibility and mobile devices.

Solution:

Mobile web design and accessibility are closely connected because both aim to make websites easy to use for everyone, regardless of device or ability. After exploring the W3C Web Content Accessibility and Mobile Web resources, it is clear that many best practices overlap and can support both areas at the same time.

One key overlap is the use of structured content. Using proper headings (h1, h2, etc.) helps screen readers understand the page, and it also allows mobile users to quickly scan content on small screens. Clear structure improves usability for all users.

Another important practice is adding alternative text (alt text) to images. This helps users with visual impairments understand images through screen readers. It also helps mobile users when images fail to load due to slow internet connections.

Responsive design is also essential. Websites should adapt to different screen sizes using flexible layouts. This improves the experience for mobile users and also supports accessibility by allowing content to adjust for zoom and different viewing needs.

Simple navigation is another shared principle. Clear menus and large buttons make it easier for mobile users to tap links and also help users with motor disabilities. Keeping navigation simple improves usability for everyone.

Readable text and good color contrast are also important. Text should be easy to read on small screens and visible in different lighting conditions. This supports users with visual impairments and improves the mobile experience.

Web developers can support both accessibility and mobile design by following best practices such as using semantic HTML, creating responsive layouts, keeping designs simple, and testing websites on different devices and tools.

In conclusion, accessibility and mobile web design overlap in many ways. By applying these shared techniques, developers can create websites that are more inclusive, user-friendly, and effective for all users.
